Measurement of the sound absorption coefficient **Assignment:**

(reverberation room method) in accordance

with Standard EN ISO 354

Annette Douglas Textiles ACOUSTICS ®, curtain Whisper, Test object:

0% fullness, mounting distance 150 mm

(Layout: see sketch, page 2)

Vescom B.V. Client Reference:

01.01.2010 Date of assignment:

Receipt of test object: 25.02.2011 EMPA reference: 575301 R. Pieren Installation of test object: 28.02.2011 Performed by: Execution of test: 28.02.2011 Performed by: R. Diggelmann

Number of pages:

Attachments: 1: Fundamentals, Calculations

2: Test Facility

The measurement of the sound absorption of absorbing materials as well as the data analysis and determination of the sound absorption coefficient α_S is described in Standard EN ISO 354 (2003). Details of the measurement procedure, the test layout, installation and dimensions of the test facility (reverberation room), a list of the measurement equipment and the respective calibration dates are to be found in the internal Quality Assurance Document SOP-177-6 (Nr. 1059).

The description of the object and the results are presented on page 2. The numerical data represent the official values. These values are limited to the objects actually measured in the EMPA facility; they cannot necessarily be applied to a series.

The measurement accuracy for α_S is given as the standard deviation as a function of frequency in accordance with previous experience for the equipment employed:

Low frequency range 100 - 250 Hz: +/- 0.1; Middle frequency range 315 - 800 Hz: +/- 0.05; High frequency range 1000 - 5000 Hz: +/- 0.02.

In the reverberation chamber a test area of 3m x 4m was fixed on a closed frame of height 150 mm.
